

ABSTRACT OF THE DISCLOSURE

A system for assisting elevator mechanics at completing the various tasks during a work day provides remote and automatic access to various kinds of information and communications. A planning module provides a prioritized task list for the mechanic to follow through the day. An information module provides the mechanic access to various types of safety, technical and location information to help the mechanic to arrive at locations and complete tasks in a more efficient manner. A communications module facilitates communication between the mechanic and elevator service company base locations through wireless communication links.
